### 2019 Annual Drinking Water Quality Report Lewisburg Water Association/Lewisburg-Ingram Mill North PWS#: 0170011 & 0170049 April 2020

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water.

If you have any questions about this report or concerning your water utility, please contact Barry Caldwell at 901.488.7161. We want our valued customers to be informed about their water utility. If you want to learn more, please attend the annual meeting scheduled for Thursday, November 12, 2020 at the Lewisburg Water Office located at 2787 HWY 305, Olive Branch.

Our water source is from wells drawing from the Sparta Sand & Winona Tallahassie/Winona Aquifer. The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Lewisburg Water Association have received moderate susceptibility rankings to contamination.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that we detected during the period of January 1st to December 31st, 2019. In cases where monitoring wasn't required in 2019, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

<sup>\*</sup> Most recent sample. No sample required for 2019.

As you can see by the table, our system had no violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some contaminants have been detected however the EPA has determined that your water IS SAFE at these levels.

We are required to monitor your drinking water for specific contaminants on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance period.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601.576.7582 if you wish to have your water tested.

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the LEWISBURG WATER ASSOCIATION is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous calendar year in which average fluoride sample results were within the optimal range of 0.6-1.2 ppm was 7. The percentage of fluoride samples collected in the previous calendar year that was within the optimal range of 0.6-1.2 ppm was 46%.

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the LEWISBURG -INGRAMS MILL NORTH is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous calendar year in which average fluoride sample results were within the optimal range of 0.6-1.2 ppm was 2. The percentage of fluoride samples collected in the previous calendar year that was within the optimal range of 0.6-1.2 ppm was 17%.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1.800.426,4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline 1.800.426.4791.

The Lewisburg Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

2019 Annual Drinkfig Water Quality Report Lewisburg Water Association/Lewisburg-Ingram Mill Morth PYVS#: 0170011 & 0170049 Acril 2020

We're pleased to present to you this year's Annual Ocality Water Report. This report is designed to inform you about the quality water and services we defiver to you every day. Our constant goal is to provide you with a safe and dependable supply of disking water. We want you'ld understand the efforts we make to continually improve the water beatment process and protect our water resources. We are committed to ensuring the quality of your water.

If you have any questions about this report or concerning year water utility, please contact Barry Caldwell at 901.488.7161. We want our valued customers to be informed about their water utility. If you want to learn more, please attend the annual meeting solvedued for Thursday, November 12, 2020 at the Lewisburg Water Office located at 2787 HWY 305, Olive Branch.

Our water source is from wells drawing from the Sparta Sand & Winorra Tailatass A-Winorra Aquifer. The source water assessment has been completed for our public water system to determine the overall susceptibility of its driving water supply to identified potential sources of doctamination. A report containing detailed information on how the susceptibility determinations were made has been furnished your public water system and is available for viewing upon request. The wells for the Lewisburg Water Association have received moderate susceptibility radiations to contamination.

We mustisely monitor for contaminants in your dinating mater according to Federal and State laws. This table below lists all of the dripting water contaminants that we detected during the period of January 1° to December 3°°, 2019. In cases where monitoring waters operated in 2019, the table relateds the most recent results. As water travels over the surface of land or underground, it dissolves indicately coccurring minerals and, in some cases, redispatche materials and can pick up substances or contaminants from the presence of aximals or from human activity, microbial contaminants, such as values and bacteria, that may come from sewage treatment plants, such as sales and medials, which can be naturally occurring or ground from understock operations, and wildlife, incorpanic contaminants, and medials, which can be naturally occurring or ground from understockes, which may come from a vestion and values expanic chemicals, which can be naturally occurring or understocked which may come from a vestions and septic systems, rediscriber contaminants, which can be within a seen of the result of oil and gas production and mining activities. In order to ensure that top water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remarable that the water passes a health risk.

In this table you will find many lemms and abbreviations you might not be familiar with. To help you belter understand these terms we've cooled the following definitions:

Action ( ) the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must now.

Maximum Conteminant Level (MCL) - The "Maximum Alouso" (MCL) is the highest level of a conteminant that is allowed in driving inelec. MCLs are set as close to the MCLCs as Readile using the best available treatment technology.

Alsownum Contambiand Level Goal (ACCLG) - The "Goal" (ACCLG) is the level of a contaminant in dividing water below which there is no incom or explected risk to health. IACLGs allow for a margin of safety.

Maximum Registual Disinfectant Level (MRDC) – The highest level of a disinfectant allowed in challeng water. There is comincing evidence figit addition of a disinfectant is occasion to control microbial contaminants.

Maximum Residual Districtant Level Goal (URDLG) — The level of a directing water districtant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of districtants to control microbial contaminants.

Paris per milion (opm) or Altiligrams per liter (mgl) - one part per milion occresponds to one minute in two years or a single penny in \$10,000.

Parts per Billion (ppb) or Micrograms per Ker - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

# 2018 Annual Drinking Water Quality Report Lewisburg Water Association/Lewisburg-Ingram Mill North PWS# 0170011 & 0170049 April 2019

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe srid dependable supply of drinking water. We want you're understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to ensuring the quality of your water.

If you have any questions about this report or concerning your water utility, please contact Barry Caldwell at 901.488,7161. We want our valued customers to be informed about their water utility. If you want to learn more, please attend the regularly scheduled meetings held on the last Tuesday, of each month at 6:00 PM or the annual meeting scheduled for Wednesday, November 6, 2019 at the Lowisburg Water Office located at 2787 HWY 305, Olive Branch.

Our water source is from wells drawing from the Sperts Sand & Windna Tallahassle/Windna Aquifer. The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identified potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Lewisburg Water Association have received moderate susceptibility rankings to contamination.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that we detected during the period of January 1st to December 31st, 2018. In cases where monitoring wasn't required in 2018, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of anitnels or from human activity, microbial contaminants, such as viruses and bacteria, that may come from aswages treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as satis and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mixing, or farming; posticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and remiring; posticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and remiring posticides and petroleum production, and can also come from gas stations and saptic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that trap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain a test small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best evellable treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal (MCLG) is the level of a contaminant in drinling water below which there is no known or expected risk to health." MCLGs allow for a margin of safety."

Maximum Residual Disinfectant Level (MRDL) — The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

Meximum Residual Disinfectant Level Goel (MRDLG) — The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single panny in \$10,000.

Parts per billion (ppb) or Micrograms per litter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Most recent sample. No sample required for 2018.

As you can see by the table, our system had no violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some contaminants have been detected however the EPA has determined that your water IS SAFE at these levels.

We are required to monitor your drinking water for specific contaminants on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance period.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds, to 2, minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested, information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.eps.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 801,578,7582 if you wish to have your water tested.

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the LEWISBURG WATER ASSOCIATION is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous catendar year in which average fluoride sample results were within the optimal range of 0.8-1.2 ppm was 7. The percentage of fluoride samples collected in the previous catendar year that was within the optimal range of 0.8-1.2 ppm was 58%.

To comply with the "Regulation Governing Fluoridation of Community Water Supplies", the LEWISBURG INGRAMS MILL NORTH is required to report certain results pertaining to fluoridation of our water system. The number of months in the previous calendar year in which average fluoride sample results were within the optimal range of 0.6-1.2 ppm was 4. The percentage of fluoride samples collected in the previous calendar year that was within the optimal range of 0.6-1.2 ppm was 31%.

All sources of drinking water are subject to potential contemination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chamicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1.800.426.4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infactions. These people should sook advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hottline 1,800.426,4791.

The Lewisburg Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.
